

The Universal Crypto Faucet

Project pitch

James Austgen

It's 2026

- L2s & new blockchains are *cheap to use!*
- We should be in crypto utopia by now

It's 2026

- But getting access to crypto, even a *tiny amount*, can still be incredibly difficult

In the past, compute was all you needed

- Anyone could join with their CPU (later, GPU)
- Didn't need any initial value to participate
- Faucets actually worked

Now, even getting testnet funds is difficult

- Sophisticated airdrop/faucet farmers can defeat many anti-Sybil mechanisms
- Reliance almost exclusively on centralized providers

Disgusting anti-Sybil “solutions”

Error!

GitHub authentication is required. Please sign in with GitHub to use the faucet.

Sign in to **GitHub**

ⓘ This faucet is built for developers. GitHub accounts are validated to ensure fair usage — some accounts may not pass verification. For other ways to get devnet SOL, check out the [full guide](#) ↗

Invalid ETH mainnet balance. Please note, you'll need a small mainnet balance on this wallet in order to use the faucet. This is to prevent abuse.

I'm not a robot

PoW Faucets are the only reliable source

- But actively tries to restrict
 - Google reCAPTCHA
 - IP address discrimination
 - Artificial limits

Ethereum testnet faucets get handouts from centralized issuance

- pk910's Faucet gets airdropped 100,000,000 testnet ETH at genesis

```
899 "0x6Cc9397c3B38739daCbfaA68EaD5F5D77Ba5F455": {
900   "balance": "100000000000000000000000000000000"
901 },
```

Ethereum testnet faucets get handouts from centralized issuance

- Author gets upset if you read the obfuscated source code

Response Payload

```
1  /*
2   If you can read this, you're probably trying to farm my faucet.
3   Please stop! You're making the situation worse for everyone.
4  */
5  (function(Q,f){var Q8={Q:0x111,f:0xd1,C:0xfe,O:0xef,E:0xe2},I=q,C=Q
```

[https://faucets.pk910.de/captcha/captchaChallenge.php?
t=1780325086606&faucet=sepolia](https://faucets.pk910.de/captcha/captchaChallenge.php?t=1780325086606&faucet=sepolia)

You can CPU mine today

- PoW chains still exist
- Some have resisted ASICs
 - RandomX: PoW algorithm **optimized for general-purpose CPUs**

Numbers

- \$0.05/day on my laptop (2,000 H/s)
 - Send a transaction on a 0.005 gwei chain (like Base) **every 6 minutes**
 - On OP mainnet, **under 1 minute**
 - Sepolia testnet, **0.27 seconds of mining**
 - At 1 sepETH = \$0.006 (today's price)

What is missing?

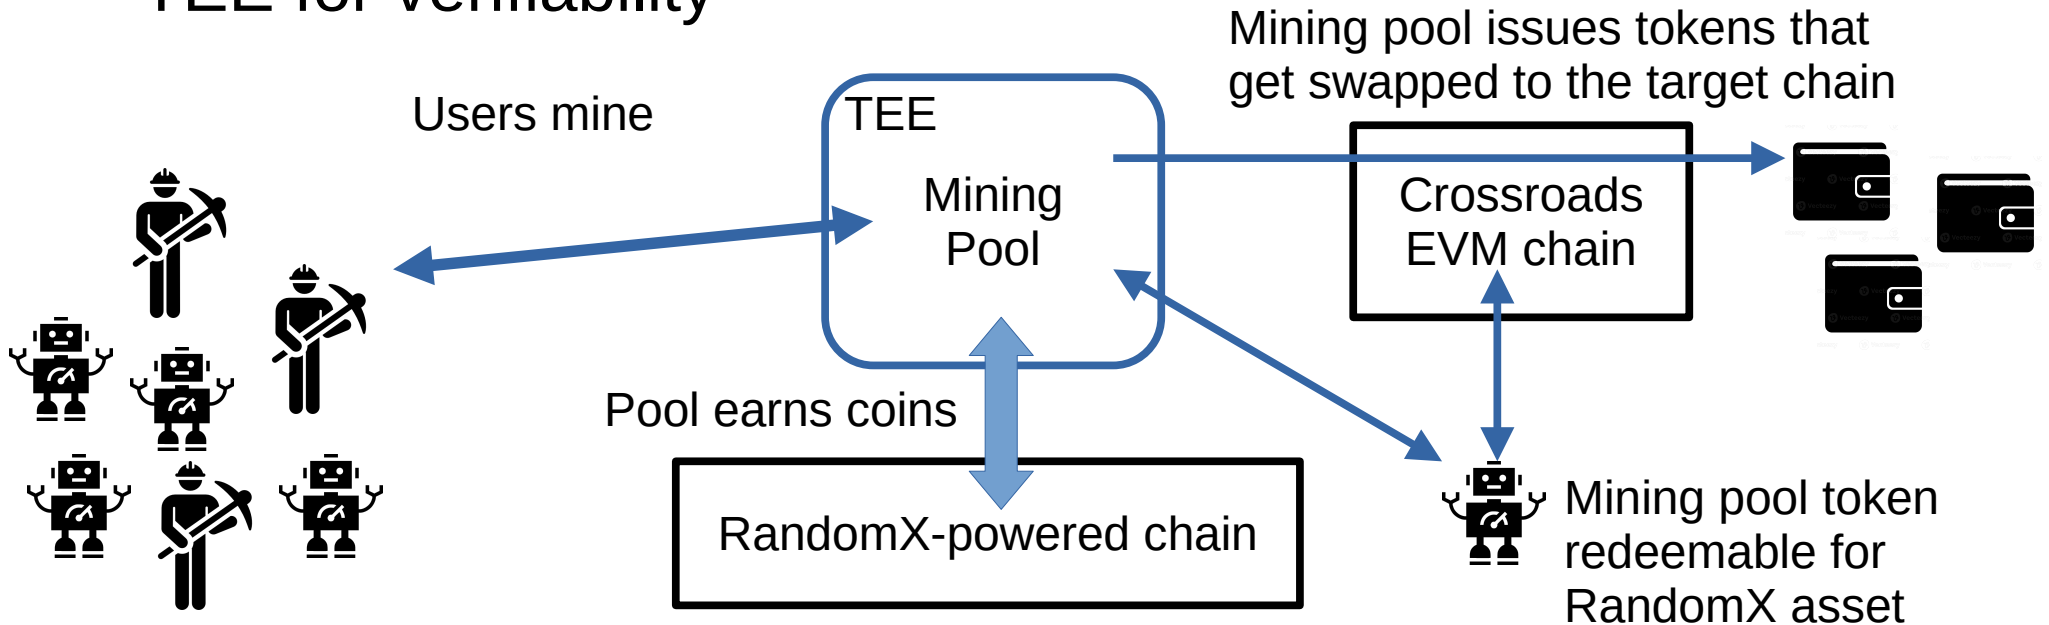

- Method to bootstrap funds on testnet *or* mainnet
- No proof of humanity, social login, “proof of machinehood”, residential IP requirement
- **No limits**

You can purchase testnet tokens...

- LayerZero
 - **Charges \$1 for cross-chain transfers** (even between Sepolia and OP Mainnet/Arbitrum)
 - You need some OP ETH or Arbitrum ETH to start
- Agents start with nothing...

The pitch

- Self-funding PoW faucet you can use with a CPU
- Crossroads to assist with payouts on arbitrary chains
- TEE for verifiability

We can do this! But we need you

- Frontend interface & graphics
- TEE infrastructure
- Backend/mining pool expertise (PPS? PPLNS?)
- Smart contracts
